My own kit:

Backpack of the day, (Either a Lowe Alpine day pack or a medium REI

Traverse Newstar, depending on the season):

One pair of cheap imitation Carhartts work pants

wool shirt

two changes of underwear

two pairs of wool socks with capilene liner socks

two t-shirts

change of longjohns (late fall through early spring)

small towel

All packed in large ziplock bags

gloves (lightweight wool liners and medium-weight leather shells)

wool watch cap

shatter-resistant sunglasses

wool scarf

Spyderco folding knife

Buck Special sheath knife

Gerber Multi-Tool

50' duct tape

50' parachute cord

one bottle, aspirin

one bottle, Pepcid

one tube, generic triple antibiotic ointment

ten 3"x3" gauze pads

30 assorted bandaids

one roll, adhesive tape

two pairs, surgical gloves

8-oz bottle, Doctor Bronners miracle patent medicine soap or whatever.

one bottle, SPF 15 waterproof sunblock

one bottle, 100% DEET bug dope

3 days worth of Nicoret (TEOTW would be a bad time for a relapse :)

Mini-Mag light, extra bulb, two sets of extra AA batteries

six Cyalume light sticks, assorted colors

AM radio, with more batteries of its own.

Yaesu 2M/440 HT, with yet more batteries

compass

Food bag containing: Hot cereal mix, tea bags, jerky, powerbars, ramen

noodles, Tabasco sauce, small sealed bottle of vitamin pills, and the like

(Roughly 10,000 calories total)

MSR Whisperlite 600 with about a quart of white gas

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (8 of 9) [4/10/2002 12:38:30 PM]

two 1Q Nalgene lexan water bottles, two 1Q army surplus canteens, and a

half-gallon water bag.

One MSR MiniWorks filter-make sure that the filter element is in good

shape.

Mil-surplus ripstop poncho with liner

sleeping bag and ridgerest pad(Oct 15-april 15)

Armaments as dictated by local laws and situation

(When I go camping normally, the above is what I take although I leave the

radio at home and bring better food)

old school ID

medical insurance card

spare apartment and truck keys

\$25 prepaid phone card

\$50 paper

~\$5 in change

topo maps of Local Area

Road maps of ON and QC

small spiral notebook

mechanical pencil

YMMV

Mike's Bugout Bag FAQ. v2.2 (Copyright Mike S. Medintz, 1998)

This document will be archived at

http://www.idir.net/~medintz/surv_faq/bugout.txt

This document may not be archived nor retransmitted in any way, shape, or form, other than in full accord with the terms and stipulations of http://www.idir.net/~medintz/surv_faq/disclaim.txt

All comments, constructive criticism, compliments, and suggestions should be sent to me at medintz@idir.net and/or posted to the misc.survivalism newsgroup (I check both daily). Unconstructive criticism

and rude remarks should be sent somewhere else-I'll welcome civil disagreement but none other.

"Survivalism" as it's called in the mass media is more an art than a

science-there are dang few right or wrong answers. The unofficial motto of

our newsgroup is "Your Mileage May Vary," and rightly so. These represent

the best answers that I can find for my situation, generalized as much

as possible without losing all general value. Your situation is probably

a fair bit different, and you should use your local conditions and local

needs to drive your planning. This document is neither a recipe, nor a

road map. It's merely a prod to tell you a few of the problems that you

should be pondering.

1) What is a bugout bag?

A bugout bag is a bag that a person keeps pre-packed for emergencies.

Should that person be forced to evacuate their home and be unable to call

upon their usual services due to emergency, the bugout bag is essentially

what they live out of.

2) How do I decide if I need one?

Is there ANYTHING that you need to worry about that could cause either a

lack of essential services or a need to evacuate?

Let me put it another way: Do you live in a utopia with absolutely no

severe weather, no floods, no hailstones, no crime, no riots, no tornadoes, no hurricanes, no meteor strikes, no terrorism, and is the very

picture of Heaven on Earth? I doubt it. Therefore, you need a bugout bag.

2.5) How do I decide whether or not I need to bug out?

That's a toughie. It depends upon the incident.

In cases of hurricanes, it's generally a good idea if you're directly in

the hurricane's path. Modern houses simply cannot be expected to withstand

the strong winds that hurricanes bring. Ditto wildfires. They don't bring

high winds, but they will burn your house down around you if they get

there.

On the other hand, tornadoes are probably a good excuse to hole up in the

basement. The damage from tornadoes is extremely localized, and the lead

time is too short.

In the case of earthquakes, there's no lead time at all to be able to

escape and an attempt will more often than not result in being stuck in

traffic-one of the worst situations to be in.

In the case of a HazMat spill, you almost certainly should get the hell

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (1 of 9) [4/10/2002 12:38:30 PM]

out. Hazardous Materials got their name for a reason, and it's extremely

difficult to make a house airtight to the degree necessary.

Civil disturbance is one of the trickiest questions. If the riot is

severe, and appears to be spreading towards your neighborhood, then your

best bet is to run. On the other hand, if the rioting is not spreading

your way, then to run might result in being stuck in traffic, or in the

fighting.

Ultimately, the decision of whether to bug out or sit tight will have to

be made based upon your own individual situation. Obviously, you will want

to select the option that maximizes your chances of survival.

Therefore,

you'll want to consider the following:

a) What is my threat? Is my home adequately hardened against this threat?

b) If I leave, do I have a specific destination in mind? Will I become a

refugee? Is the threat at home so serious that I am willing to risk being

a refugee or entering a shelter?

c) Can I get there from here? Do I have a route pre-planned and alternate

routes figured out? Are there any choke points on my route such as bridges

or freeways that might be out of service because of weather or rioting or

chemical spills?

d) Am I in less danger at home than at my bugout destination?

3) What do I put in this bag?

Let that be determined by what may cause you to have to bug out.

The U.S. Federal Emergency Management Agency makes certain recommendations.

They recommend that each person keep food, water, clothing appropriate to

the season, medicines, and sanitary needs for a bare minimum of three days.

As a simple fact, relief agencies can not be relied upon to begin supplying any real level of relief services for a minimum of 72 hours and

are overtaxed and overextended even when running at their maximum efficiency.

The less that you need to rely on a service that may or may not be available, the safer you can justifiably feel. For this reason, I

personally would recommend a bare minimum of a week's supplies, assuming

that food, gasoline, batteries, clean water, and clean clothing can not be

found, and that police, fire, and ambulance service will be severely

overextended and therefore not entirely reliable..

3.1) Food:

Figure a bare minimum of 2000 calories of food with 60 grams of protein

per day, biased heavily towards starches but with extra fats in the winter.

Cooking supplies (stoves, firewood, gas) will be limited- this whole thing

will be like a one-man birthday party. You get no presents that you didn't

bring for yourself.

Personally, I like ramen noodles, powerbars, summer sausage or beef jerky,

trail mix, and vitamin supplements. Boring fare indeed, but you can live

off of it for a while if need be. Some correspondents have suggested

macaroni carried in ziplock bags, some have said salt pork and ship's

biscuit, and therefore we conclude that Your Mileage May Vary. If you don't

reasonably expect to have to travel a significant distance on foot, you can

supplement that with canned foods that can be eaten cold or reheated as

possible. Canned stew, canned spaghetti, canned pork and beans, all work

well for this. (In all things, these should be foods that you're somewhat

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (2 of 9) [4/10/2002 12:38:30 PM]

accustomed to, lest you get sick from 'intestinal culture shock.')

Also, if you drink coffee, tea, or pop on a regular basis, you may be a

caffeine addict without knowing it. Sudden deprivation may affect your

judgement or your ability to think, sleep, or work, and keeping coffee or

tea in your bag is advised. As a matter of fact, some wilderness

Emergency Medical Technicians have been seen to carry caffeine pills

(Vivarin or similar) for this very reason. In the same vein, smokers or

recent ex-smokers like myself should keep nicotine gum or patches packed-staying quit under the stress of an emergency evacuation is not

going to be the easiest thing in the world.

Any good book on backpacking should have a number of recipes involving

lightweight food that requires no refrigeration. The "Sports" section of

the local Barne's and Noble or the back of the Sierra Club magazine both

have a number of books about this very subject. Also, Backpacker magazine

has recipes for lightweight foods that don't need refrigeration, or so my

spies inform me. And then there's the Boy Scouts of America Cooking merit

badge pamphlet, with a few recipes of its own. (I'd suggest a bottle of

tabasco sauce would improve ANY of them)

3.2) Water:

The average human needs a gallon per day for drinking alone. There ain't

any two ways around it-without water you will die within three days, and

it won't be a pleasant way to go. (It has been suggested by one m.s

correspondent that it's possible to live on half of this if you don't move

much, don't move at all except in the cool of the night, and ration sweat

ruthlessly. Given how likely it is that you'll be able to sit still for

three days, however, I stand by my claim of a gallon a day, more in

summer and more in deserts)

There are multiple ways to store water. The less-imaginative (and still

quite successful) person would keep water jugs of the type used in car

camping. Some people will take a clean 2-liter pop bottle, fill it about

3/4 full from the tap, and add a small amount of bleach. Then, cap the bottle

and freeze it. This ensures that the drinking water in question will be cold

and potable (when thawed), and can be used to keep perishables from

spoilage.

Some people reported using 15-gallon pony kegs (normally used for beer) to

store drinking water. I've never tried this, but it does seem feasible.

Beyond drinking water, you'll also need water for basic hygiene. That

starts at another gallon a day, and the sky's the limit.

Do you have a way to purify water? The easiest method that I know of is to

treat the water with an iodine preparation such as Potable Aqua or PolarPure. I use PolarPure, as it's probably the cheapest way for an

individual to disinfect water, but Potable Aqua is probably a bit easier.

My emergency bag also contains a MSR Miniworks water filter with a spare filter element. See Patton Turner's Water Purification FAQ elsewhere

on this web site for more info.

3.3) Medicines:

In short, if you don't know how to use it, don't bother keeping it.

If you use any medicine on a regular basis, make sure you have a supply

on hand, be it nitro pills, Paxil, allergy medicine, birth-control pills,

or whatever.

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (3 of 9) [4/10/2002 12:38:30 PM]

Anything else, don't keep it if you don't know how to use it. If you've

never been trained or instructed in the use of a particular medicine by a

competent medical professional, then remedy that deficiency before adding

to your stash.

For what it's worth, an OTC pain reliever, an antacid, an

antihistamine, and some sort of anti-diarrhea med have been known to come

in pretty durn handy. If you expect to have to evacuate to a place above

8,000 feet or therabouts, you might want to talk to your doctor about

drugs to treat altitude sickness.

While not strictly a drug, insect repellent and bug nets have their place.

Mostquitos and ticks are a royal pain, and chiggers can make you almost

with you'd stayed behind and died. Some people claim that garlic and/or

lots of B vitamins work quite well...personally, I prefer a pure liquid

DEET mixture. Again, YMMV. (Recent fluff pieces on CNN have mentioned that

the mosquito genus Anopheles, which carries malaria, has been spotted in

small areas of the southern US for the first time in decades. If you live

in Florida or Texas that should affect your planning, as a disaster that

makes you evacuate may also interrupt mosquito abatement)

Few first aid skills can be self-taught. It's heartily advised that you

seek a high pre-professional level of skill in first aid (First Responder

or EMT would be good) and supplement that with a book such as Auerbach's

Medicine for the Outdoors AND consultation with your doctor regarding

the material. Through your doctor, you can also get medicines that are

potentially quite useful but not OTC.

3.4) Hygienic needs:

First and foremost, soap. When regular medical attention is less than fully

reliable, the ability to prevent infection becomes even more important.

Maybe you have a topical antibiotic like Neosporin (as most of us do) but

that's not much help until you already get infected.

Along with the soap, a clean hand towel makes washing easier.

Pre-moistened towelettes like the ones they give out on airplanes, or

alcohol prep pads, can make cleaning a little easier. Just remember to

pack out your trash. (BTW, alcohol pads on broken or cut skin sting like

hell-be forewarned)

Need one mention toilet paper? Non-poison-sumac leaves, cornhusks, et

cetera aren't always so easy to find. Diapers if you have small children

travelling with you.

Got any plans for sunburn or windburn? Some Chapstick and a bottle of

SPF 15 sunblock is essential unless you plan to stay inside. Even then,

sunblock is cheap. (And don't try to get out of it based upon it being

winter-snow reflects a lot of sunlight right into your face. For that

reason, a good pair of impact-resistant sunglasses is useful in summer

and essential in winter.)

3.5) Light

Hard to see without it.

You'll need a good, solid, durable flashlight at the least. I personally

keep a 2AA Mini-Maglite with at least one spare bulb and two changes of

spare batteries dedicated to the bugout bag, and also have a 2D MagLite

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (4 of 9) [4/10/2002 12:38:30 PM]

with extra bulb and batteries next to the bed.

Beyond that, an area light can be rather useful. Something like a lantern and/or a bunch of Cyalume lightsticks are quite useful for actually trying to work under bad lighting conditions.

If you go with a lantern, using a lantern capable of burning the same fuel

as your stove, space heater, whatever makes your supply situation a lot

simpler.

Let your needs drive your planning.

3.6) Navigation:

How well do you know the roads in your county? In the neighboring counties?

Think you have it perfect?

I thought so.

There's no shame in that-six, seven counties make a lot of roads to

memorize. I couldn't do it for Douglas County, Kansas, and I know better

than to even try for something as complex as Chicago.

Start with a decent compass (I like the Silva Ranger 15CL, but that's a

little feature-rich and high-dollar for most people who just want a backup).

A cheaper Silva or Suunto should be adequate for the non-compass-obsessed

<vbg>.Carrying a second compass to avoid the problem of one getting a

little out of whack is advised. Avoid the really cheap ones.

Add to that both road maps and topo maps for your county and the surrounding counties. Road maps are available from the American Automobile

Association (membership with them is valuable in any case, and especially

when you need either maps, towing, or a bond card) or a respectable

bookstore, and topo maps can be had from the U.S. Geological Survey or

state Geological Survey. In many areas, both types are available from the

county surveyor's office. County Surveyors also know the magnetic declination of your county, and can help you get your compass properly

adjusted.

Beyond that, GPS and other toys may be nice, but I don't much care for

them. Too much money for a gadget that does what your brain and a map can

do, and they'll make you overconfident besides. And let's not even get

started on batteries.

The Boy Scouts of America publishes a merit badge pamphlet on Orienteering.

While not being a perfect manual, this pamphlet is both inexpensive and

will provide a more-or-less adequate education-especially when

supplemented with the sort of expert instruction that can be had from

an Outward Bound or Sierra Club outing.

3.7) Clothing and Shelter:

Pack at least one full change appropriate to the season, plus extra underwear

and socks. (Note: 'Appropriate to the season' means no cotton outerwear

or longjohns in the winter-that's asking to freeze to death).

Then add a coat. Then a hat. Then gloves. Then footwear (I like a pair of

Wolverine steel-toed boots with lug soles, and adding a pair of wool-lined

mukluks in the winter and track shoes or sandals in the summer).

At the bare minimum, you'll need a tarp of some kind to keep the wind and

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (5 of 9) [4/10/2002 12:38:30 PM]

rain off-and that's in the summer. In the winter, you'll need to add a

decent sleeping bag, shell, and mattress. Luxury is unimportant, but being

able to remain warm even with wet equipment is critical.

It would be wise to refer to a good reference on backpacking for ideas on

what to wear.

3.8) Tools

A knife is essential-sturdy, sharp knives are among the most useful tools

made. The big "rambo" knives are almost useless, though. A sturdy folder

(Buck or Schrade or Gerber or the like) and maybe a midsize sheath knife

or kukri/parang is all you need.

Pliers, shovels/E-tools can be helpful, but can also be extra weight. A

good compromise are the so-called "Leatherman" tools-I personally like the

Gerber version over the Leatherman. It's ten bucks more, but the handles

don't pinch the skin off your fingers when you use the pliers)

Duct tape can fix anything-they don't call it the "handyman's best friend"

for nothing.

As for other tools, well, let your needs drive your plans.

If you bring canned food, bring a can opener. You can get cheap folding

P-38 can openers at Walmart three for a buck. Not having one to open your

beans is frustrating sometimes.

Some sort of cordage is almost a requirement. I personally like parachute

cord, but some correspondents have reported that nylon seine twine is

almost as strong, a little more widely available, and takes up a fair bit

less space.

3.9) Weapons

KNOW YOUR LOCAL LAWS! Bugging out only to end up in jail facing a weapons

charge is a bad way to handle an emergency.

Let your needs drive your planning. Do you plan to fight an infantry

engagement? If the answer to this is 'yes' then a full rifle or shotgun is

indicated, along with a psychiatric evaluation. Fighting a war while

running from a chemical spill would at the least be really bad timing.

At any rate, too many guns and too much ammunition will weigh you down,

and has a nasty habit of seeming indiscreet.

Whatever weapons you do carry, make damned sure that they will function even

with a lack of regular maintainance, that you can maintain them with a

minimum of equipment, and that you can shoot effectively. You owe that

much to the people around you-an armed untrained man is nothing more than

a danger to himself and others. (People who want advice should probably

think very hard, and then post to misc.survivalism. You'll get advice.

You'll probably get a lot more advice than you wanted. I can give advice

by email, but I am neither an expert on firearms, nor firearms laws, nor

your local conditions and your own needs, and I'm not generally inclined

to discuss my own plans.)

3.10) Signalling and Radios

First, I'd refer you to the Communications FAQ elsewhere on this website

and posted to the misc.survivalism newsgroup.

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (6 of 9) [4/10/2002 12:38:30 PM]

A radio capable of receiving all-news formatted AM stations should be the

first radio that you add. After that, a licensed ham should add a 144MHz

FM handheld with extra batteries, and an unlicensed individual should get

a license. (Anyone wanting to bitch about my politics for adding the bit

about licenses should redirect their comments to dev/null where they'll

get just as much attention)

3.11) Misc. Stuff

Keys-when you lock the house you'll probably want to be able to unlock it

afterwards. Also, do you have spare car keys? Spare mailbox key?

Safe-deposit-box key?

Extra photo ID just for the bugout is a help-an old military ID or expired

driver's license...non-US citizens should have their passports and visas

with them at ALL times. Also, copies of your insurance policies can be a

big help should the house need repair or you need medical care. If you

live in one of the third-world backwaters like Illinois that requires a

specific ID to transport a firearm, then you want a copy of that if your

bag includes a gun.

A pre-paid phone card goes a long way too...you might just need to call

Mom and tell her that you won't be in for dinner that weekend because

you're running for your life.

Passport can be helpful, and if you're outside of your country of citizenship then you do not want to be separated from your passport or WHO

Yellow Book EVER.

3.12) Packing it all up

You need a bag that will hold all this stuff, with some degree of protection

from the elements. Personally, I prefer just using a large bookbag...keep

it simple. (Plus, in college towns like this one a backpack doesn't look

all that out of place). As a rule of thumb, if the bag is perfectly packed

when you first pack it, then once you open it up in the field you'll never

get it repacked. Therefore, a bag should probably be about half again as

big as you actually need.

Note about brands of equipment:

I'm not a big fan of US Military-issue equipment. It's made by the lowest

bidder in a contracting system that seems driven more by politics than by

producing quality equipment, and as a result almost all of the Mil-Spec

gear that I've used has turned out to be shoddily-made crap. Well, not all

of it. My canteens have held up well, as has my ripstop poncho. OTOH, I've

ruined more ALICE packs through normal use than I care to think about.

The REI house brand is usually serviceable-my current pack was made by REI

and has seen almost three years of moderately hard use with very little

apparent wear.

As far as compasses go, the higher-end Silvas, Suuntos, and Bruntons are

almost identical in quality as far as I can tell. They all run in the

\$40-\$50 range.

High-grade sleeping bags abound-I currently have an Slumberjack Everest

Elite that has served well for almost ten years, but is now facing retirement-sleeping bags lose their insulating power with time. Still

perfectly adequate for 3-season use, but not for winter if I have any

<http://members.aol.com/OiledLamp/bugout.txt>

<http://members.aol.com/OiledLamp/bugout.txt> (7 of 9) [4/10/2002 12:38:30 PM]

choice in the matter. (Editor's note-the bag has since been supplanted by

a Sierra Designs synthetic-fill model rated down to +5 degrees F ...excellent bag for winter use if a little bulky)

For knives-if you want a folder, you want a lock-blade for safety reasons.

Buck and Gerber knives tend to be very well made, warrantied from here

to eternity, and hold their edges reasonably well.

As far as sheath knives go-I like the Buck Special with 6" blade.

Everything else that's at all well made is is way beyond my budget. (Well,

except for the US Marine-issue KaBar, which is heavy and a little awkward

in my opinion. Others will disagree.)

I won't recommend one firearm over another in this document. Shooting

skill takes precedence over the choice of firearm itself any day.
